

Francisco Filipe – Cover Letter

Dear Hiring Manager,

I am a Backend Engineer specialising in distributed systems, high-scale data platforms, and Python backend development, with over 10 years of programming experience and 5+ years building production-grade systems professionally in fully remote environments.

At Little Forest UK, I helped lead the re-architecture of a legacy Java-based crawling platform into a scalable Python distributed system, contributing to the growth of the platform from approximately 100K to over 100M requests. My work has focused on designing resilient backend services, distributed task processing pipelines, and large-scale data workflows using Python, Celery, Redis, PostgreSQL, Elasticsearch, Docker, and Linux infrastructure.

In addition to backend development, I have been responsible for production reliability, infrastructure maintenance, system monitoring, API development, and operational troubleshooting across distributed services. I am comfortable owning systems end-to-end, from architecture and implementation through deployment and long-term maintenance.

I enjoy working on technically challenging systems involving scalability, reliability, automation, and high-volume data processing. Having worked remotely for several years in an international environment, I am also comfortable collaborating across teams and time zones while maintaining a strong sense of ownership and engineering quality.

I am currently open to new remote opportunities across Europe and the UK, including both full-time and B2B engagements, where I can continue contributing to backend infrastructure and distributed platform engineering challenges.

I would welcome the opportunity to discuss how my experience could contribute to your team.

Kind regards,

Francisco Filipe
